# LUKOIL'S ECTO 100 FOR ULTIMATE DRIVING EXPERIENCE - NEW AT THE GAS STATIONS

It should be noted that LUKOIL was the first in Russia to launch Euro 4 standard fuels, followed by Euro 5, and that it was the first to produce fuels with improved performance and environmental standards under the ECTO brand. Following the same trend, a couple of years ago the Company produced a new ECTO 100 gasoline.

ECTO 100 is the result of a years-long work of LUKOIL on the improvement of fuels applying modern technologies that have enabled the development of a basic formula using natural high-octane components. In addition to increasing the engine power, acceleration performance and reduced fuel consumption, ECTO 100 also ensures that the properties developed by the designers of sports cars are fully demonstrated and accordingly, it fully meets the requirements of FIA and FIM.

"Consistency in offering high-quality products has always been essential for LUKOIL. Traditionally, the Company has been investing substantial funds in the modernization of its refineries and the development of technologies, thus offering the products that surpass all standards relating to the energy industry. As our response to the ever-increasing expectations of drivers, at this point, we offer ECTO 100 at 16 LUKOIL SERBIA filling stations in Serbia, while planning to introduce this product at overall 41 facilities" - said Nastas Mihajlović, the Commercial Director, adding that the use of ECTO 100 increases the efficiency of high-revving engines, at the same time preserving all the additional fuel properties developed under this brand.
